Latest android auto version number

Photo: GoogleA's new version of Android Auto is finally here of sorts. Google started rolling out a beautiful new version of Android Auto late last month, and your device should offer you a move to the new look and feel when you plug it into your car. If not, you'll want to check the buried setting to force this update manually. According to Android police, some Android fans have connected and disconnected their devices with their cars without ever receiving a notification — a critical statement, we note — to upgrade to the latest version of Android Auto. While it's possible that Google will automatically upgrade everyone's Android Auto at some point, there is no point waiting around for that day to happen if you can access its new version right now. To find out if you're eligible and start the update process, if you're not prompted to do so, you want to open the Android auto app on your phone. Tap the hamburger icon in the upper-left corner, and tap settings. Then look for the very top item on your screen, which should be an option to Try the new Android Auto. Screenshot: David MurphyEnable it, and you must have a brand new version of Android Auto the next time you connect your phone to your car. While the search giant has really fixed some of the android Auto issues lately, many of them have actually been linked to other apps, including the Google app (which also powers Google Assistant). After trying the new version of a short drive today, perhaps the most noticeable change in Android Auto 5.3 is improved performance overall, as everything seems to be more responsive and fluid. Although I never encountered big bugs with Android Auto, one of the things I always thought would be improved was how quickly the application responded to touch input. Of course, it's also something that depends on the quality of your head unit, but once the operation is registered, Android Auto should respond much faster. And as it turns out, some improvements are really included in version 5.3. For example, switching between apps — I mainly use Waze and Spotify while driving — is now significantly faster, and the difference on my head unit against the previous version is easily noticeable. Another change that I noticed today is that Android Auto starts and closes much faster than version 5.2. I'm using samsung galaxy note9 to power Android Auto, it seems that this improvement was created with this recent update, although it may very well be the result of Samsung's own refining experience with some apps. My Android phone is currently running at the April 2020 security patch level. Overall, even if android Auto 5.3 doesn't include any big fixes or new feature, it looks like Google is focusing more on refinement of the app's experience in general. Of course, as we all learned the hard way, it's something that depends on many factors, including, unfortunately, how happy you are. Android Auto makes frequently used smartphone apps and directly into the car dashboard. It ignores the native information and entertainment system with a familiar, easy-to-use interface that many drivers prefer. This reduces dangerous distractions, at least according to Google (but not under the AAA), and it makes upgrading older cars with new features a breeze. Like most things in our digital life, Android Auto and smartphones in general have to be updated frequently with the latest software, but the update process here is a little different than you think. The important thing to remember when thinking about the best way to update Android Auto is that the images and features you see on the screen of your dash are a direct projection from your smartphone. This means that the version of the Android car you're using is a reflection of the android version your phone is running on. It may not be possible to run the latest version of the software on older phones, but newer versions of the phone software will also allow you to see the latest version of Android Auto. Here's how to update your Android Auto: Further reading Update android operating system The first thing you need to do is to pay out which version of Android your phone is currently running. To do this, open the Phone Settings app and scroll to the bottom of the menu where you want advanced to appear. From there, select System Update, where you will see your current android version and security patch level. You should be notified when a new version of Android is available for your smartphone, but if you don't or if you accidentally clear the notification, you can take the same steps to actually update the software. Even after jumping through these hoops, it is still quite possible to miss the Android Auto update. Your smartphone app must have the same settings option that lets you check if you can enable it there. Android auto settings are a way to choose the new user and features by selecting Try the new Android auto option. Google sometimes adds features or changes to Android functionality without sending out a full update. While it is thought to schedule detailing when upgraded software features debut, new features often appear off schedule. Pixel phones are the only devices that alert you to new releases when they happen, so you can miss it if you use another phone. Some smartphone companies use extra time to optimize software for their specific phones, which significantly delays the launch of new versions. In-vehicle updates Since Android Auto works mainly on your phone, there are limited updates to manage the vehicle side. If your vehicle's current information and entertainment system doesn't support Android Auto, it's unlikely that you'll get a chance through the update. Android Auto users need to save the car firmware / software In some cases, this means that you must take updates of the re-shipment (OTA) from the vehicle manufacturer, if available. The last resort would be to order your car dealership so the technician can update your system. The technician may not necessarily activate the latest features, but at least your information and entertainment system will work safely and smoothly. Editor's suggestions for an Android phone running Android 6.0 and more with a data plan. Car or stereo system that is compatible with Android Auto. High quality USB cable. (For wireless connection) Compatible phone (see list) and after-sales car stereo from JVC, Kenwood or Pioneer. 5.9.604623-release Dec. 1, 2020 5.8.604353-release November 10, 2020 5.7.603963-release October 28, 2020 5.7.603953-release October 12, 2020 5.7.603943-release October 8, 2020 2020 5.6.603443-release September 11, 2020 Google has just released a new version of Android Auto, and judging by the release of comments and early feedback from users who rushed to install, this one brings not only several highly anticipated fixes, but also a new feature that is welcomed by some. With this update, Android Auto reaches version 5.1.5006 — this new build is currently rolling out through the Google Play Store, so if you don't see it just yet, you can always download the APK to install the update manually. First and foremost, it seems that this version of Android Auto eliminates the voice commands bug. This is an issue that mainly affected Samsung smartphones, but it is possible that other devices were also affected, making it impossible to control certain functions by voice. For example, many complained that sending messages with a voice command no longer works for Android Auto, so when you install today's update, everything should be repeated in a normal state. Then, Android 5.1 is considered to correct a glitch that broke the steering wheel control — confirmation in this regard is not yet available, and although some users claim that this feature now works as expected, others say the update did not resolve the issue and the steering button still does not work. According to official release notes (which are the same as in the previous version), Android Auto should now display the time information in the status bar. As many users already know, this is a feature that is spreading waves, so this is probably the reason Google keeps it from releasing notes on new builds. So, after installing this update, more users should be able to see the time icons in the status bar, although it goes without saying that the rollout continues, so don't be too surprised if you have to wait a bit more to get this. The good news is that this small feature seems to have been activated with a server-side switch, and it could be displayed any day now without the need for another update. Here is the full changelog for version 5.1.5006 (although it's no different from version 5.0): Ability to turn off media notifications. Time information in the status bar. Ability to hide / show apps android auto. Instead , it is connected to an Android smartphone that can display some apps, entertainment, and mirrors on the car dashboard. The platform was announced in 2014 and received a major design in 2019. Android Auto is designed to help keep the driver's attention on the road, not on their smartphone. The platform restricts users to a small number of apps, mostly those used on media such as Spotify, YouTube Music, and others. Map mapping is also a key part of the platform with Google Maps and Waze, which offers apps. Users can use Android Auto for selected vehicles that offer integration with the platform. There are over 500 different vehicles that offer Auto support from brands including Ford, Hyundai, Chevrolet, Nissan, Toyota, Subaru, and many others. Not long after its initial debut, Google also added an experience to smartphone screens, but it was removed in favor of a new Google Assistant driving mode. Android Auto is also available in third-party head units for older vehicles that do not offer support. Popular brands include Pioneer, Sony, Alpine and others. Here's a review below that lets you learn more about the Google platform and read our revised design here. Here.
